THAI METEOROLOGICAL DEPARTMENT

3-month Climate Prediction of Thailand

During May – July 2026

Issued on 29 April 2026

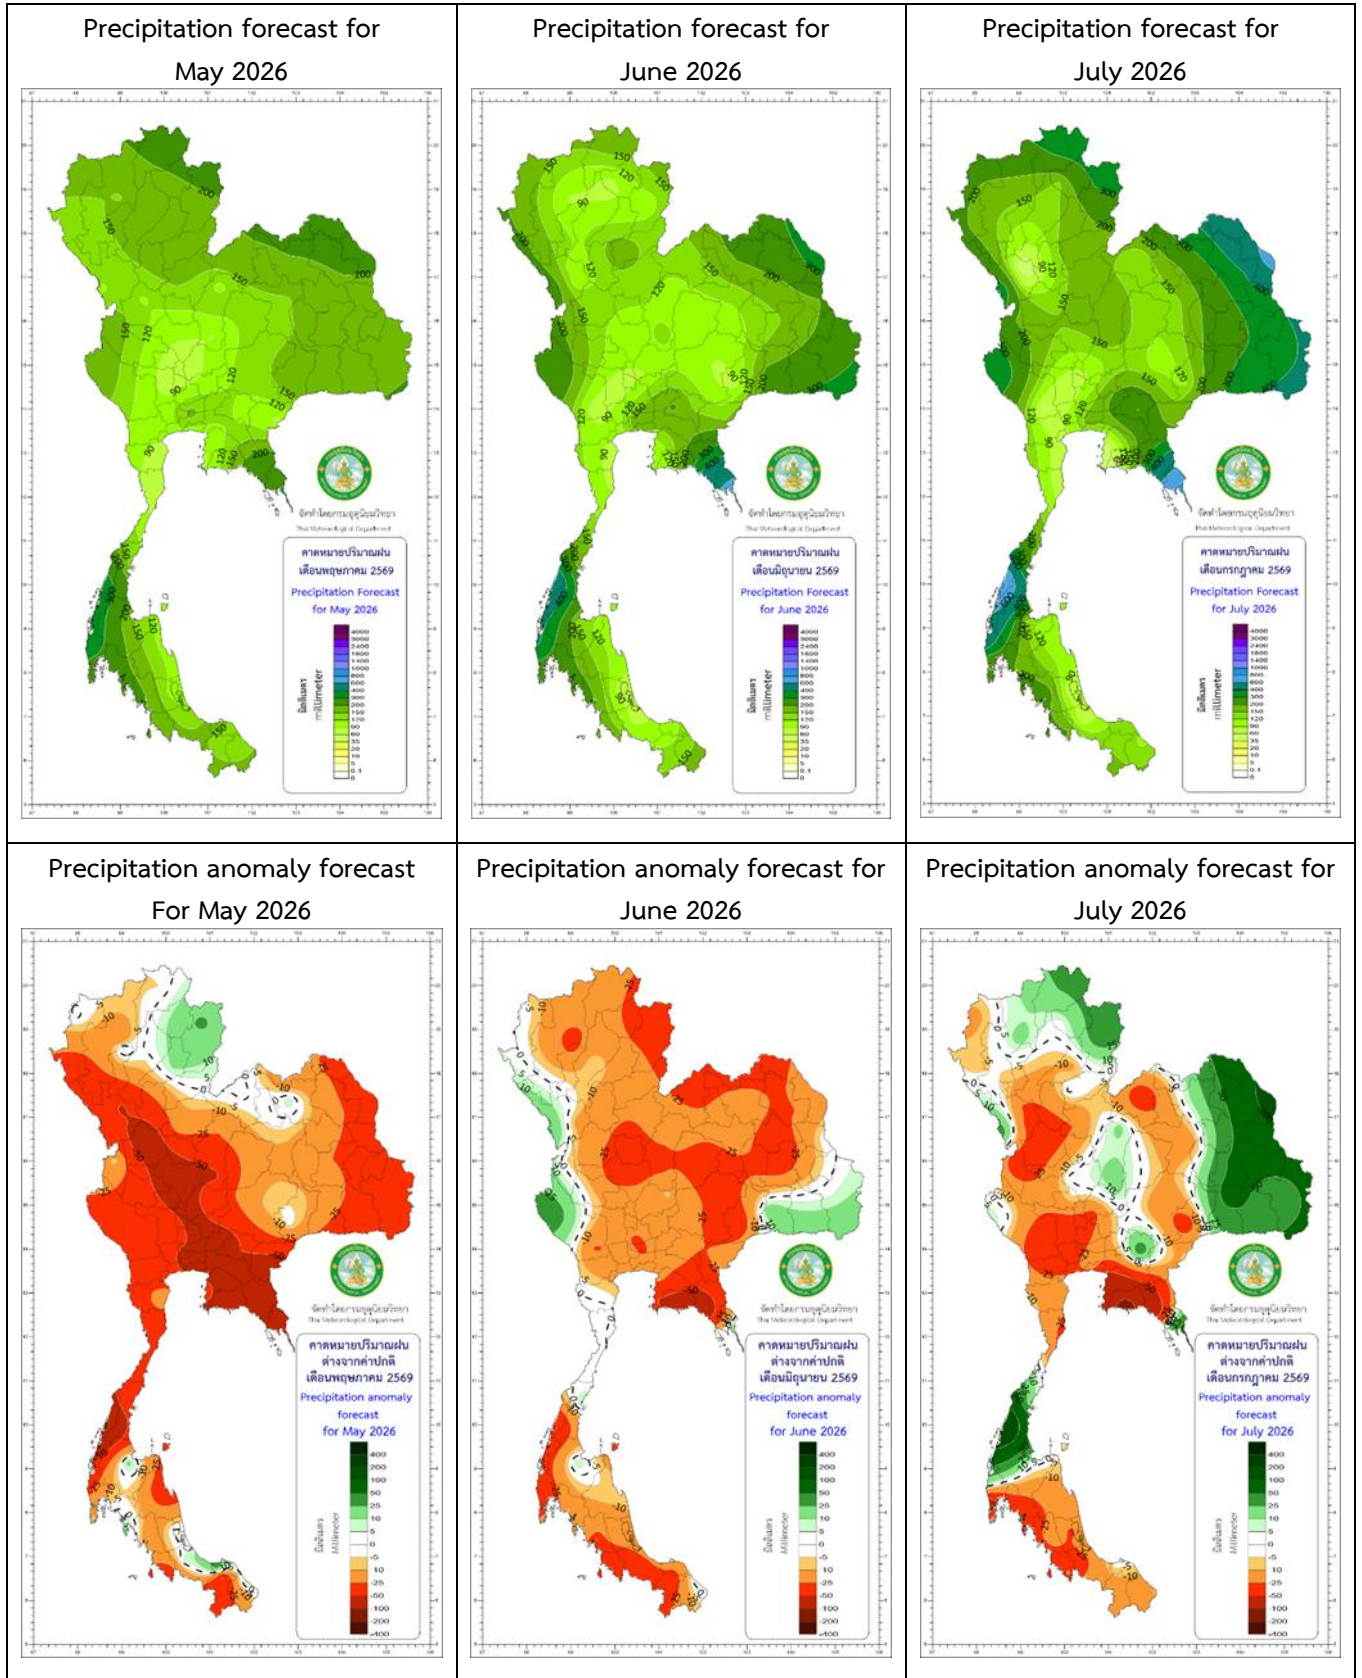

Thailand climate for February – March – April from 30-year normal (A.D. 1991 - 2020 or B.E. 2534 - 2563 baseline average)

May : As being the transitional period from the summer to the rainy seasons, the common weather during the 1st half of this month is usually sweltering. Also, thunder rain storms and summer thunderstorms occur often. Sometimes, hail happens too. And from the influential heat low-pressure air mass cells, mostly at the 2nd half of this month as the start of the rainy season, temperature will reduce with increasing rain. In other words, the prevailing wind over Thailand will start to transform into southwest monsoon while the low-pressure trough placing over Malaysia moves upward to place over the Southern Thailand and the central part of Thailand consecutively. Besides, some tropical cyclones developing in the Andaman Sea and the Bay of Bengal may move near or toward the western side of Thailand further.

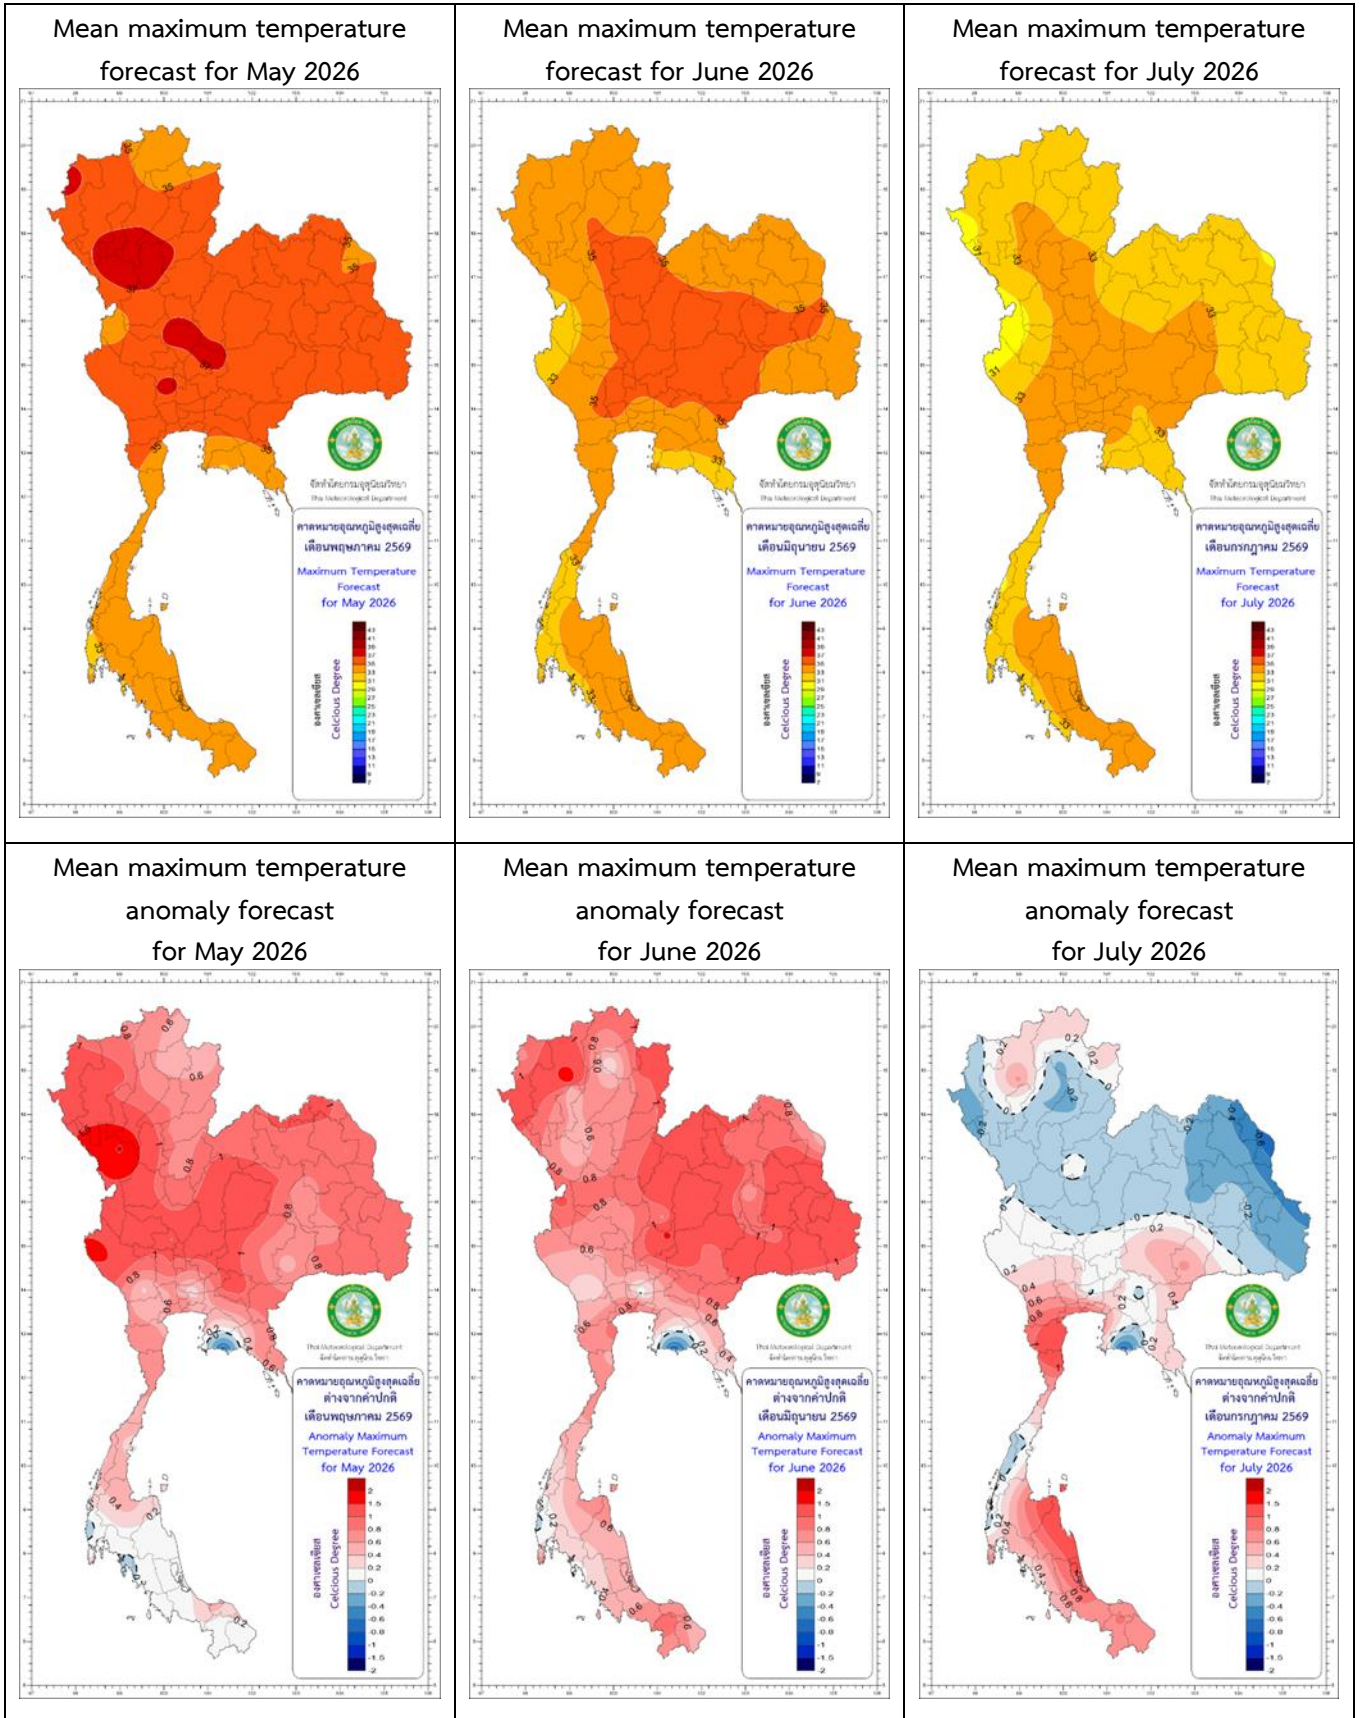

June : Usually, rainfall is abundant during the 1st half of this month from the influential Southwest Monsoon prevailing over Thailand together with the low-pressure trough placing over the central portion of Thailand. Afterward, rain will reduce and dry spell may occur for 1 - 2 weeks especially around the Upper Thailand due to the low-pressure trough moving upward to place over the southern portion of China including with the prevailing Southwest Monsoon over Thailand weakening. Additionally, some tropical cyclones from the Pacific Ocean or the South China Sea may feasibly move near or toward Thailand, specifically at the eastern portion of Thailand.

July : During the 1st half of this month, the dry spell will often occur continuously from late June because the low-pressure trough still prevails over the southern portion of China along with the Southwest Monsoon prevailing over Thailand mostly weakens. As a result, many areas will meet little or no rain continuously for many days. Later during the 2nd half of this month, abundant rainfall will happen again because of the coming back low-pressure trough moving downward to place over the Upper Thailand together with the Southwest Monsoon prevailing over Thailand becoming more active periodically. Additionally, some tropical cyclones may move near or toward Thailand along the eastern portion of Thailand.

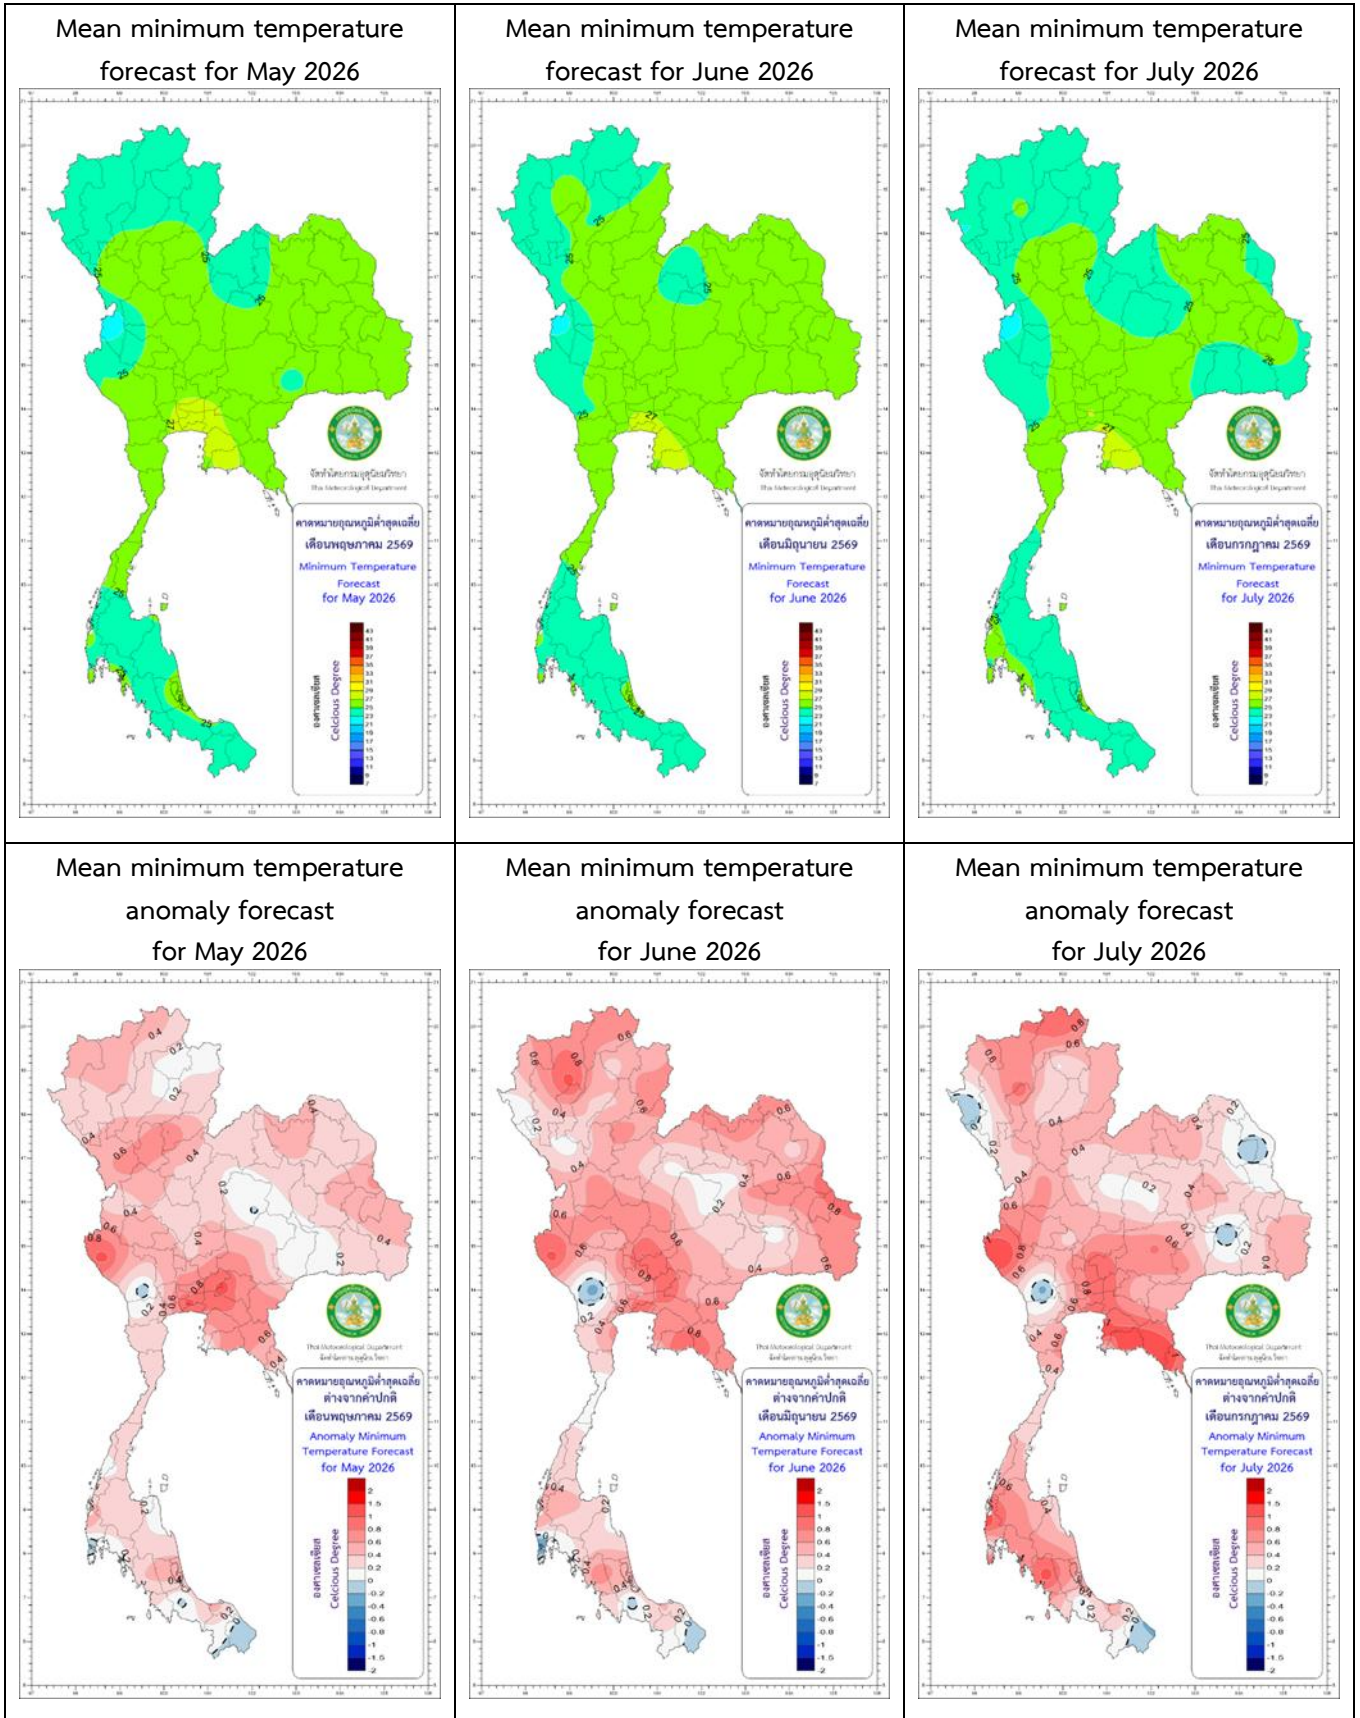

Precipitation (mm/month) and Anomaly (mm/month) Forecast:

Mean Maximum Temperature (°C) and Anomaly (°C) Forecast:

Mean Minimum Temperature (°C) and Anomaly (°C) Forecast:

*** Caution: ***

During May 2026: Some low-pressure air mass cells may develop around the Andaman Sea. Then, they may strengthen to become depressions or tropical cyclones further. Their movements are toward the western side of Thailand. Thus, the western portions of both of the northern and central parts including with the Southern Thailand will meet more rainfall.

During June & July 2026: Frequently, some tropical cyclones will develop at the Western Pacific and move pass the Philippines toward the South China Sea. This influences the Southwest Monsoon prevailing over Thailand and the Gulf of Thailand to strengthen causing Thailand to meet more rainfall, specifically around the coastal areas of the eastern part and the Southern Thailand (west coast).

During late June until early July 2026: Often, dry spell will occur as the amount and distribution of rainfall reduces immensely. Consequently, water shortage for agricultural.

Table 2 : Prediction of Mean Maximum Temperature (Tmax) comparing with normal:

Part	Prediction						Normal (Baseline period: 1991-2020)*		
	May 2026		June 2026		July 2026		May	June	July
	Mean Tmax	Comparing with Normal	Mean Tmax	Comparing with Normal	Mean Tmax	Comparing with Normal	Mean Tmax	Mean Tmax	Mean Tmax
Northern	35-37	Above normal	33-35	Above normal	32-34	Near normal	35.2	33.4	32.4
Northeastern	35-37	Above normal	34-36	Above normal	32-34	Near normal	34.9	33.8	32.8
Central	36-38	Above normal	34-36	Above normal	33-35	Near normal	35.9	34.5	33.6
Eastern	33-35	Above normal	32-34	Near normal	32-34	Near normal	34.0	33.0	32.4
Southern (East Coast)	33-35	Near normal	33-35	Above normal	33-35	Above normal	33.9	33.4	33.0
Southern (West Coast)	32-34	Near normal	31-33	Near normal	31-33	Near normal	32.9	32.1	31.8
Bangkok and Vicinity	34-36	Above normal	34-36	Above normal	33-35	Near normal	35.0	34.0	33.4

Table 3 : Prediction of Mean Minimum Temperature (Tmin) comparing with normal:

Part	Prediction						Normal (Baseline period: 1991-2020)*		
	May 2026		June 2026		July 2026		May	June	July
	Mean Tmin	Comparing with Normal	Mean Tmin	Comparing with Normal	Mean Tmin	Comparing with Normal	Mean Tmin	Mean Tmin	Mean Tmin
Northern	24-26	Near normal	24-26	Above normal	24-26	Near normal	24.4	24.5	24.2
Northeastern	24-26	Near normal	25-27	Above normal	24-26	Near normal	25.0	25.1	24.7
Central	25-27	Above normal	25-27	Above normal	24-26	Above normal	25.5	25.1	24.8
Eastern	26-28	Above normal	25-27	Above normal	25-27	Near normal	26.1	25.8	25.5
Southern (East Coast)	24-26	Near normal	24-26	Near normal	24-26	Near normal	24.9	24.7	24.4
Southern (West Coast)	24-26	Near normal	24-26	Near normal	24-26	Above normal	24.9	24.7	24.5
Bangkok and Vicinity	26-28	Above normal	26-28	Above normal	26-28	Above normal	26.7	26.3	26.1

Remarks: - * Normal means average during the 30-year period (A.D. 1991 – 2020 or B.E. 2534 – 2563).

- This long-range climate forecast is created by applying some climate models and statistical methods, the public then should follow the daily weather forecast news from the Thai Meteorological Department for more accuracy further.
- The next 3-month climate forecast will be published online before the end of December 2026.
- Further enquiry of monthly climate, 3-month climate and seasonal forecasts can be preceded at Tel: (662)-398-9929 or Fax: (662)-383-8827
